What are we trusting?

• Trusting not to re-share?
• Trusting to act competently?
• Trusting our common incentives and aligned interests?
• Trusting algorithms and expertise?
  • Requires deep understanding of the problem, right semantics for policies
  • Does not often generalize
What needs to be shared?

- Analysis can happen at many layers
  - REN-ISAC members share derived data, not raw
- Can we do non-consumptive analysis?
  - Depends on the problem space
- Sharing publicly very hard
  - Understand the limits of anonymization
- Start simple
  - One well-defined problem
