

RQ: Real-time evidence collection

in data streams

Updates January 2022

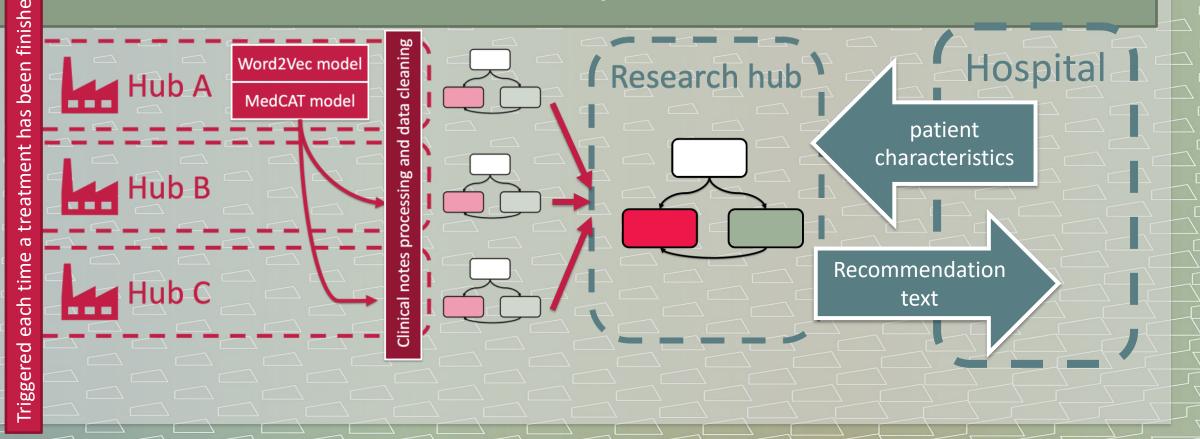

Rosanne J. Turner

Supervisors and collaborators within EPI:

- Prof. Peter Grünwald (CWI)
- Prof. Floor Scheepers (UMCU)
- Karin Hagoort (UMCU)
- Dr. Aki Harma (Philips)
- Roel van Est (Parnassia)

Centrum Wiskunde & Informati

Ideal goal: continuously update a recommender model, trained at multiple locations

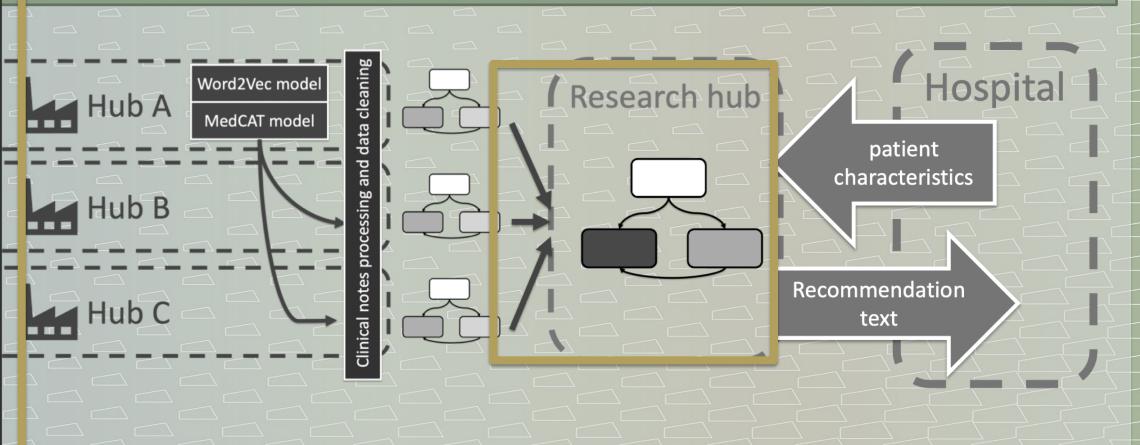

treatment has been finished

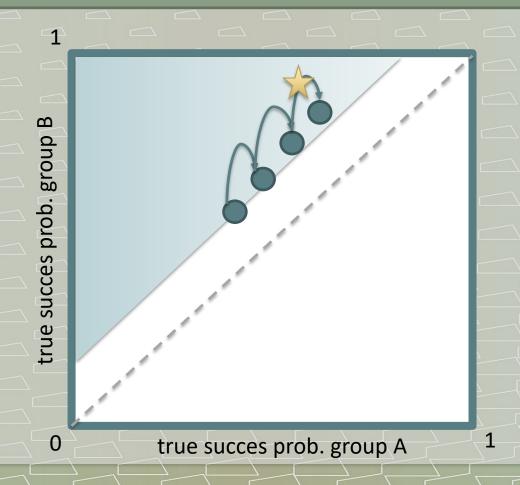

each time

Work on statistical backbone

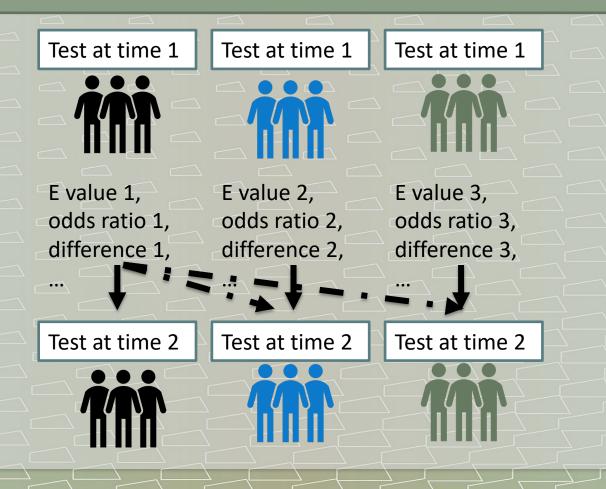

Finished statistical work

- Developed measures ("E-variables")
 for comparing different treatment
 strategies over time, at multiple
 locations
- Type-I error guarantee, can be used as alternative to p-value or for confidence intervals
- E-variable learns from data already seen to find evidence for a difference between the groups as fast as possible

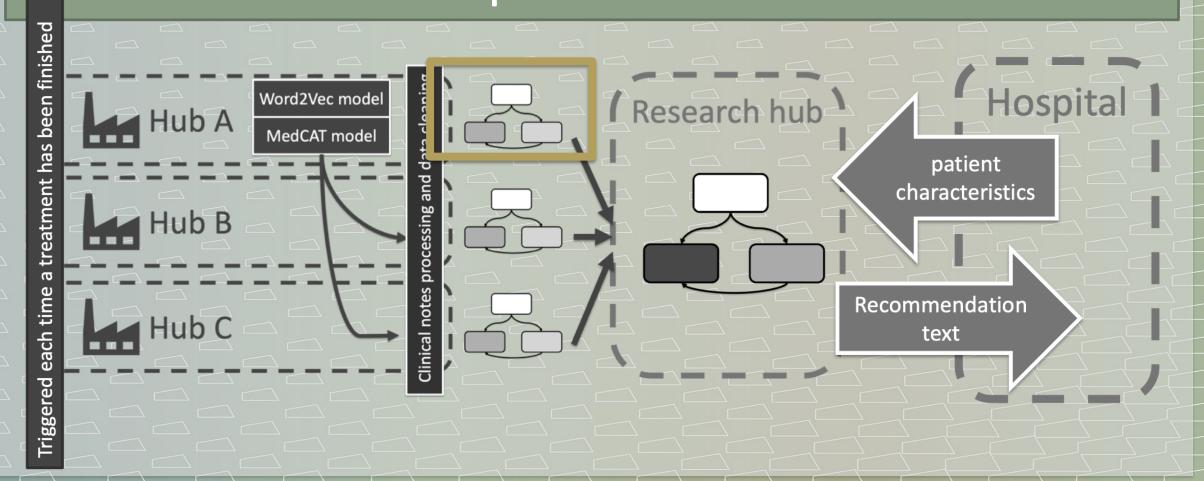

Upcoming statistical work

- Combine information from (many) small groups of patients with different characteristics over time
- Which information for model-tuning should be shared between the small groups?

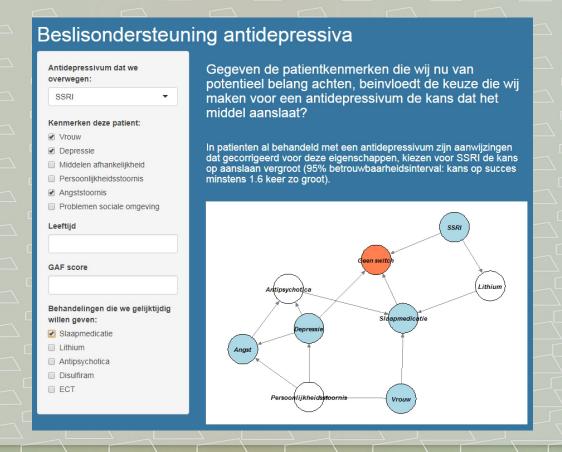

Work on predictive models

Antidepressants use case

- Bayesian network for discorvering conditional dependencies
- "If I decide to take sleep medication, does that influence probability of successful treatment outcome with antidepressant A?"

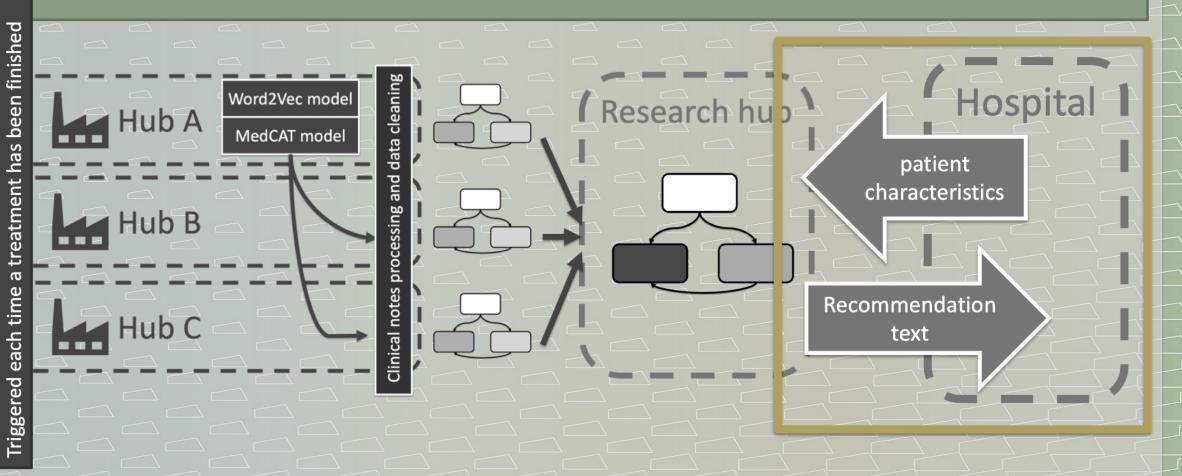

Pilot version, hypothetical patient

Centrum Wiskunde & Informatica

ECT use case

- Hierarchical Bayesian logistic regression model, with variable selection
- "What is the probability that I will respond to ECT?"

Recommender tool

Centrum Wiskunde & Informatica

Recommender tool evaluation in practice?

- "Does using the tool influence medication choice and/ or treatment outcome?"
- Medical device regulation: structured implementation of tool needed
- User experience, design

Hulpmiddel Handelingsruimte Waardevolle Al voor gezondheid en zorg

Om onderzoekers en ontwikkelaars in het traject van ontwikkeling tot opschaling van waardevolle artificiële intelligentie (AI) te helpen, biedt dit hulpmiddel aanwijzingen in de handelingsruimte binnen de wet- en regelgeving. Zo kan er vroegtijdig gestart worden met het voorbereiden op gevraagde minimale eisen of standaarden. En reflecteren op acties om tot mensgerichte en betrouwbare Altoepassingen te komen.
